

ABSTRACT OF THE DISCLOSURE

[1048] A digital display monitor module (DDMM) has a display device to display video signals provided thereto. An interactive network module (INM) removably interfaces with the DDMM to provide the video signals to the DDMM. The INM comprises an input interface and a programmable conditional access system (PCAS) to enable conditional access to at least one premium television service received by the input interface. The PCAS is programmable by at least two different service providers.
